

# ACRODIZE™ HARDCOAT

Specially designed for store-front, entry systems, and other high abuse areas, Acrodize™ Hardcoat offers a colorful alternative to anodizing.

Acrodize Hardcoat gives you the following advantages over anodizing:

- Wide selection of beautiful, long-lasting standard and custom colors
- Will not change color when in contact with mortar-like anodizing
- Will not crack like anodizing when being post-formed
- Much better resistance to salt spray
- Better color consistency throughout the project\*

Acrodize Hardcoat is a pearlescent 50% fluoropolymer (Kynar™) system,

which makes use of the same durable ceramic pigmentation as our full strength (70% fluoropolymer) system, Fluoron Classic™ II. It should be specified or used:

- When a harder fluoropolymer finish is advantageous
- When anodizing is being considered but designer colors are required
- When mortar is being used on a project
- On restoration projects to replace anodizing
- When your project will be post formed
- When an acrylic, polyester, silicone polyester or TGI<sup>®</sup> powder paint is being considered on an exterior

application (Acrodize shows better exterior weathering).

The low gloss level of Acrodize Hardcoat helps reduce the noticeability of fingerprint smudges. The added abrasion resistance will reduce damage to the coating in-house during cutting, fabrication, and pouring and debridging operations. It means less problems during transportation and on jobsite.

Once installed, added scratch resistance means added protection against the everyday abuse of routine cleaning and maintenance or from foot-traffic or the elements.
